Partitions

Partitions

This section contains a full range of lightweight partition and wall systems for use in new and existing buildings. They cover all applications, from simple space division to high performance walls

Partitions

Gyproc offers a full range of lightweight partition and wall systems. Our systems are non-loadbearing and constructed using modern, drylining techniques. Gyproc metal framed partitions and walls can be used in all types of new and existing buildings, including private and social housing, apartments, healthcare, educational facilities, recreational and industrial properties.

They cover all applications, from simple space division, through to high performance walls designed to meet the most demanding fire resistance, sound insulation, impact and height requirements.

Gyproc partition systems are constructed using lightweight materials, which can give rise to significant savings in structural design compared to masonry alternatives. Big benefits also include the speed of installation and reduction to overall build costs.

Buildings need to evolve throughout their life to suit changing demands placed upon them. Our lightweight partition systems are easy to reconfigure with minimal impact to both building and occupants resulting in less disruption, optimising the transformation process.

You may also be interested in...

For unique performance situations with specialist requirements:

- Curved partitions
- Access to build from one side only
- High levels of fire resistance
- High security including bomb blast

► Refer to C05. S01. P289 – Specialist partitions

Partitions

When specifying partitions, a number of performance characteristics are normally used to determine the required solution. Depending on the project or construction type, these performance parameters could be set by minimum regulatory standards, or a client or customer requirement for buildings that offer the highest standards of performance and comfort.

Our quick-reference partition system guide, below, allows you to simply select the performance categories of interest and identify the Gyproc partitions systems that best satisfy your project requirements.

Good practice specification guidance

Gyproc's systems are designed and tested to meet every performance requirement and are fully supported by our SpecSure® guarantee.

This means that when our systems are installed following our guidance they will achieve every performance claim we make, and if they don't then we'll put it right.

To maximise the performance achieved on site, consider the following good practice specification guidance:

- Consider flanking transmission at the design stage and ensure construction detailing is specified to eliminate, or at least to minimise, any downgrading of the acoustic performance
- Small openings such as gaps, cracks or holes will conduct airborne sounds and can significantly reduce the sound insulation of a construction. For optimum sound insulation a construction must be airtight
- When designing the layout of rooms requiring separation by sound insulating walls abutting structural steelwork, consideration should be given to the potential loss of sound insulation performance through the steelwork
- Deflection heads, by definition, must be able to move and, therefore, achieving an airtight seal is very difficult without incorporating sophisticated components and techniques. Air leakage at the partition heads will have a detrimental effect on acoustic performance of any partition. Where acoustic performance is a key consideration, steps must be taken to minimise this loss of performance
- A common mistake made when designing a building is to specify a high performance element and then incorporate a lower performing element within it: although sometimes unavoidable, for example, a door within a partition. Where the difference between insulation is relatively small (7dB or less), there needs to be a comparatively large area of the lower insulation element before the overall sound insulation is significantly affected. However, where there is a greater difference in sound insulation performance between the two elements, this would usually result in a greater reduction of overall sound insulation performance.

- 6 Crimp

Fire protection

Plasterboard linings provide good fire protection owing to the unique behaviour of the non-combustible gypsum core when subjected to high temperatures.

Fire resistance

Elements of structure such as compartment walls which are required by national Building Regulations to be constructed of non-combustible materials or 'materials of limited combustibility', should be installed without timber sole plates. All Gyproc metal stud partitions and walls are tested for fire resistance without timber sole plates. However, if a timber sole plate is included, the plasterboard linings should be fixed to protect the sole plate on either side.

Three high performance fire resistant boards are available from Gyproc – Gyproc FireLine, Gyproc Duraline and Gyproc MultiBoard.

Gyproc FireLine is a cost-effective fire resistant board suitable for use over a wide range of specifications.

Gyproc Duraline combines high levels of fire performance with high impact resistance. Gyproc MultiBoard is a general purpose building board offering high levels of fire performance, impact and moisture resistance. Its flexibility makes it ideal as a lining for curved partitions, walls and ceilings.

Fire-stopping

Gaps around the perimeter of elements and inadequate sealing at junctions and around service penetrations can result in building elements failing to meet their specified levels of fire protection. The services themselves can also act as a mechanism of fire spread. By designing zones through which all services pass, the number of individual service penetrations can be minimised. Since most services are installed by specialist contractors, it is important that adequate liaison is maintained with the drylining contractor to ensure their proper location and firestopping. The necessity to independently support services will depend on their size and weight. Contact the Gyproc Technical Department for guidance.

Sound insulation

To achieve optimum sound insulation it is important that the partition is made airtight. At the base of the partition gaps will occur particularly when boards are lifted tight to the ceiling. Small gaps or airpaths can be sealed using Gyproc Sealant. Most remaining gaps can be sealed at the jointing stage using Gyproc jointing materials. It is recommended that gaps in excess of 6mm are bulk filled using a Gyproc Jointing material after application of Gyproc Sealant (see Figs 3 and 3a).

The standard of sound insulation achieved on site may be influenced by flanking transmission and direct transmission via doors, glazing, services, etc. Therefore, care should be taken to ensure that the associated structure is suitable to achieve the level of sound insulation required.

Where high levels of sound insulation are important, Gyproc SoundBloc offers significantly enhanced performance compared to the same thickness of Gyproc WallBoard.

Technical drawing illustrating the assembly of a window frame using extruded aluminum profiles. The drawing includes exploded views of the components and a cross-section of the assembled frame.

Components and Assembly:

- Top Rail (4):** The upper horizontal profile.
- Bottom Rail (5):** The lower horizontal profile.
- Left Sash (6):** The vertical profile on the left side.
- Right Sash (7):** The vertical profile on the right side.
- Corner Connector (2):** A small L-shaped piece used to join the sashes to the rails.
- Drainage Channel (3):** A small profile used to manage water drainage.
- Isolation Pad (1):** An orange, wedge-shaped pad used for weatherstripping.

Dimensions:

- 150mm:** Indicated for the height of the top rail and the width of the bottom rail.
- 300mm:** Indicated for the height of the right sash.
- 1200mm:** Indicated for the width of the frame sections.
- 150mm:** Indicated for the width of the bottom rail.

Assembly Details:

- The top rail (4) is joined to the left sash (6) and right sash (7) using corner connectors (2).
- The bottom rail (5) is joined to the left sash (6) and right sash (7) using corner connectors (2).
- The drainage channel (3) is installed in the bottom rail (5).
- The isolation pad (1) is placed between the sashes and the bottom rail (5) to provide weatherstripping.

- 1 Gyproc plasterboard or Glasroc F specialist board
- 2 Gypframe 'C' Stud
- 3 Gypframe Floor & Ceiling Channel to sleeve studs
- 4 Gypframe Floor & Ceiling Channel cut and bent to form door head
- 5 Timber door frame and architrave
- 6 Gypframe 'C' Stud to maintain stud module
- 7 Gypframe Floor & Ceiling Channel cut and bent to extend up studs

NB At the base, the channel is cut and bent to extend 300mm up the studs and fixed each side with two Gyproc Wafer Head Drywall Screws. The studs each side of the opening are sleeved full height of opening with Gypframe Floor & Ceiling Channel.

Standard GypWall construction details (continued)

To be read in conjunction with system specific details. Refer to relevant system sections

27

Alternative door frame for fixed partition heads only (maximum 1200mm width) to satisfy
BS 5234: Parts 1 & 2: 1992 - Heavy and Severe Duty (60kg door)

- | | |
|---|---|
| 1 Gyproc plasterboard or Glasroc F specialist board | 6 Gypframe 'C' Stud to maintain stud module |
| 2 Gypframe 'C' Stud | 7 Gypframe 'C' Studs fixed back to back with Gyproc Drywall Screws at 300mm centres staggered |
| 3 Gypframe Floor & Ceiling Channel to sleeve studs | 8 Plasterboard infill (same type as lining) cut to fit between studs |
| 4 Gypframe Floor & Ceiling Channel cut and bent to form door head | 9 Gypframe Floor & Ceiling Channel cut and bent to extend up studs |
| 5 Timber door frame and architrave | |

NB Advice should be sought from the door manufacturer prior to the construction of these details.

NB At the base, the channel is cut and bent to extend 300mm up the studs and fixed each side with two Gyproc Wafer Head Drywall Screws. The studs each side of the opening are sleeved full height of opening with Gypframe Floor & Ceiling Channel.

NB The principle of this alternative detail is only suitable for GypWall, GypWall **ROBUST** and GypWall **EXTREME** for fixed head situations only.
